\* Type of earthquake mechanism and dip. Right and left-lateral strike slip are ssr and ssl, respectively. Reverse and normal are r and n, respectively. Right-lateral normal oblique motion is nssr.

++ See Notes column for explanation of calculation for each event. When two values are given, value in square brackets is calculated net slip and other is for type of slip provided in original slip distribution.

# Digitized distance along fault rupture trace.

& See Table 3 for key to references.

+ See **electronic supplement** for notes bearing on basis for assigning column values and location of epicenter when plotted.
